CS 581 – ADVANCED ARTIFICIAL INTELLIGENCE

TOPIC: PROBABILITY THEORY

♦ http://www.cs.iit.edu/~mbilgic

https://twitter.com/bilgicm

MOTIVATION

- The agent needs reason in an uncertain world
- Uncertainty can be due to
 - Noisy sensors (e.g., temperature, GPS, camera, etc.)
 - Imperfect data (e.g., low resolution image)
 - Missing data (e.g., lab tests)
 - Imperfect knowledge (e.g., medical diagnosis)
 - Exceptions (e.g., all birds fly except ostriches, penguins, birds with injured wings, dead birds, ...)
 - Changing data (e.g., flu seasons, traffic conditions during rush hour, etc.)
 - •
- The agent still must act (e.g., step on the breaks, diagnose a patient, order a lab test, ...)

TENTATIVE PLAN

- Probability background
- Classification
 - Naïve Bayes, logistic regression, neural networks
 - Maximum likelihood estimation, Bayesian estimation, gradient optimization, backpropagation

Decision making

- Bayesian networks, influence diagrams, Markov decision processes, multi-armed bandits
- Variable elimination, value of information, Bellman equations, value iteration, policy iteration, UCB1, ε-greedy

• Reinforcement learning

• Prediction, control, Monte-Carlo methods, temporal difference learning, Sarsa, Q-learning

SOME EXERCISES

- In a class, 70% of the grad students got an A. John got an A. What is the probability that John is a grad student?
- You design a Covid test with the following behavior
 - P(+ | covid) = 0.95; P(- | covid) = 0.05
 - $P(+ \mid \sim covid) = 0.10$; $P(- \mid \sim covid) = 0.90$
 - John takes the test, and the result is +. What is the probability that John has covid?
- $P(toothache \mid cavity) = 0.75$. What is $P(cavity \mid toothache)$?

4

RANDOM VARIABLES

- Pick variables of interest
 - Medical diagnosis
 - Age, gender, weight, temperature, LT1, LT2, ...
 - Loan application
 - o Income, savings, payment history, ...
 - Exercises
 - o Grad student, Grade, Covid, Test result, Toothache, Cavity
- Every variable has a domain
 - Binary (True/False)
 - Categorical
 - Real-valued
- Possible world
 - An assignment to all variables of interest

PROBABILITY MODEL

- A **probability model** associates a numerical probability P(w) with each possible world w
 - P(w) sums to 1 over all possible worlds
- An **event** is the set of possible worlds where a given predicate is true
 - Roll two dice
 - The possible worlds are (1,1), (1,2), ..., (6,6); 36 possible worlds
 - Predicate = two dice sum to 10
 - Event = $\{(4,6), (5,5), (6,4)\}$
 - Toothache and cavity
 - Four possible worlds: (t,c), $(t,\sim c)$, $(\sim t,c)$, $(\sim t,\sim c)$
 - Some worlds are more likely than others
 - Predicate can be anything about these variables: $t \land c, t, t \lor \sim c$,

AXIOMS OF PROBABILITY

- 1. The probability P(a) of a proposition a is a real number between 0 and 1
- 2. P(true) = 1, P(false) = 0
- 3. $P(a \lor b) = P(a) + P(b) P(a \land b)$

$P(\neg a)$

- $P(a \lor \neg a) = P(a) + P(\neg a) P(a \land \neg a)$
- $P(true) = P(a) + P(\neg a) P(false)$
- \circ 1 = P(a) + P(¬a) 0
- $P(\neg a) = 1 P(a)$
- Intuitive explanation:
 - The probability of all possible worlds is 1
 - Either a or $\neg a$ holds in one world
 - The worlds that α holds and the worlds that $\neg \alpha$ holds are mutually exclusive and exhaustive

RANDOM VARIABLES – NOTATION

- Capital: X: variable
- Lowercase: x: a particular value of X
- Val(X): the set of values X can take
- Bold Capital: X: a set of variables
- Bold lowercase: x: an assignment to all variables in X
- \circ P(X=x) will be shortened as P(x)
- $P(X=x \cap Y=y)$ will be shortened as P(x,y)

JOINT DISTRIBUTION

- We have n random variables, V₁, V₂, ..., V_n
- We are interested in the probability of a possible world, where
 - $V_1 = v_1, V_2 = v_2, ..., V_n = v_n$
- $P(V_1, V_2, ..., V_n)$ associates a probability for each possible world = the **joint distribution**
- How many entries are there, if we assume the variables are all binary?

TOOTHACHE EXAMPLE

Toothache	Cavity	P(T,C)
toothache	cavity	0.15
toothache	¬cavity	0.10
¬toothache	cavity	0.05
\neg toothache	¬cavity	0.70

PRIOR AND POSTERIOR

- Prior probability
 - Probability of a proposition in the absence of any other information
 - E.g., $P(V_1, V_3, V_5)$
- Conditional/posterior probability
 - Probability of a proposition given another piece of information
 - E.g., $P(V_2, V_3 | V_5 = T, V_7 = F)$
 - $P(A \mid B) = P(A \land B) / P(B)$

MARGINALIZATION

- o Given $P(V_1, V_2, ..., V_n | V_{n+1}, V_{n+2}, ..., V_{n+m})$, where n>0 and m≥0, we can find, for example
 - $P(V_i, V_j, V_k \mid V_{n+1}, V_{n+2}, ..., V_{n+m})$ where i, j, k < n by summing out all the irrelevant variables
- Examples

LET'S ANSWER A FEW QUERIES

Toothache	Cavity	P(T,C)
toothache	cavity	0.15
toothache	¬cavity	0.10
¬toothache	cavity	0.05
¬toothache	¬cavity	0.70

- P(cavity) = ?
- \circ P(\neg cavity) = ?
- \circ P(toothache) = ?
- \circ P(\neg toothache) = ?

LET'S ANSWER A FEW QUERIES

Toothache	Cavity	P(T,C)
toothache	cavity	0.15
toothache	¬cavity	0.10
¬toothache	cavity	0.05
\neg toothache	¬cavity	0.70

- P(cavity | toothache) = ?
- $P(cavity \mid \neg toothache) = ?$
- $P(\neg cavity \mid toothache) = ?$
- $P(\neg cavity \mid \neg toothache) = ?$
- P(toothache | cavity) = ?
- P(¬toothache | cavity) = ?
- P(toothache | \neg cavity) = ?
- $P(\neg toothache \mid \neg cavity) = ?$

BAYES' RULE

- P(B | A) = P(A | B) * P(B) / P(A)
- Example use
 - P(cause | effect) = P(effect | cause)*P(cause) / P(effect)
- o Why is this useful?
 - Because in practice it is easier to get probabilities for P(effect|cause) and P(cause) than for P(cause|effect)
 - E.g., P(disease|symptoms) =P(symptoms|disease)*P(disease) / P(symptoms)
 - It is easier to know what symptoms diseases cause. It is harder to diagnose a disease given symptoms

BAYES RULE

• Can we compute $P(\alpha|\beta)$ from $P(\beta|\alpha)$?

CHAIN RULE

- $P(X_1, X_2, X_3, ..., X_k) =$
 - $P(X_1) P(X_2 | X_1) P(X_3 | X_1, X_2)... P(X_k | X_1, X_2, X_3, ..., X_{k-1})$ • or
 - $P(X_2) P(X_1 | X_2) P(X_3 | X_1, X_2)... P(X_k | X_1, X_2, X_3, ..., X_{k-1})$ • or
 - $P(X_2) P(X_3 | X_2) P(X_1 | X_3, X_2)... P(X_k | X_1, X_2, X_3, ..., X_{k-1})$ • or
 - Pick an order, then
 - P(first)P(second | first)P(third | first, second)...P(last | all_previous)

MARGINAL INDEPENDENCE

- An event α is **independent** of event β in P, denoted as P $\models \alpha \perp \beta$, if
 - $P(\alpha \mid \beta) = P(\alpha)$, or
 - $P(\beta) = 0$
- Proposition: A distribution P satisfies $\alpha \perp \beta$ if and only if
 - $P(\alpha, \beta) = P(\alpha) P(\beta)$
 - Can you prove it?
- Corollary: $\alpha \perp \beta$ implies $\beta \perp \alpha$

MARGINAL INDEPENDENCE

X	Y	P(X, Y)
t	t	0.18
t	f	0.42
f	t	0.12
f	\mathbf{f}	0.28

Is
$$X \perp Y$$
?

CONDITIONAL INDEPENDENCE

- Two events are independent given another event
- An event α is **independent** of event β given event γ in P, denoted as $P \models (\alpha \perp \beta \mid \gamma)$, if
 - $P(\alpha \mid \beta, \gamma) = P(\alpha \mid \gamma)$, or
 - $P(\beta, \gamma) = 0$
- \bullet Proposition: A distribution P satisfies $\alpha \perp \beta \mid \gamma$ if and only if
 - $P(\alpha, \beta \mid \gamma) = P(\alpha \mid \gamma) P(\beta \mid \gamma)$

QUERYING A DISTRIBUTION

• Evidence (E=e): what is known, Query (Y): variables of interest, X is the set of all variables that include E, Y, and potentially others

1. Probability query

• P(Y | e) = ?

2. MAP query

- $W = X \setminus E$ (i.e., all the non-evidence variables)
- $MAP(\mathbf{W} | \mathbf{e}) = argmax_{\mathbf{w}} P(\mathbf{w}, \mathbf{e})$
- Important: We *cannot* find **w** by finding the maximum likely value for each variable individually

3. Marginal MAP query

- $MAP(Y | e) = argmax_y P(y | e)$
- Let $\mathbf{Z} = \mathbf{X} \setminus \mathbf{E} \cup \mathbf{Y}$
- $MAP(Y | e) = argmax_v \sum_z P(z, y | e)$

MAP EXAMPLE

A	В	P(A, B)
t	t	0.10
t	\mathbf{f}	0.25
f	t	0.35
f	f	0.30

Maximum likely assignment for A = f

Maximum likely assignment for B = f

$$MAP(A,B) = \langle A=f, B=t \rangle$$

NUMBER OF PARAMETERS

- Assuming everything is binary
- P(V₁) requires
 - 1 independent parameter
- P(V₁, V₂, ..., V_n) requires
 - 2ⁿ-1 independent parameters
- \circ P(V₁ | V₂) requires
 - 2 independent parameters
- \circ P(V₁,V₂, ..., V_n | V_{n+1}, V_{n+2}, ..., V_{n+m}) requires
 - $2^m \times (2^n-1)$ independent parameters

CONTINUOUS SPACES

- Assume X is continuous and Val(X) = [0,1]
- o If you would like to assign the same probability to all real numbers in [0, 1], what is, for e.g., P(X=0.5) = ?
- Answer: P(X=0.5) = 0.

PROBABILITY DENSITY FUNCTION

• We define **probability density function**, p(x), a non-negative integrable function, such that $\int_{Val(X)} p(x)dx = 1$

$$P(X \le a) = \int_{-\infty}^{a} p(x)dx$$

$$P(a \le X \le b) = \int_{a}^{b} p(x)dx$$

UNIFORM DISTRIBUTION

• A variable X has a uniform distribution over [a,b] if it has the PDF

$$p(x) = \begin{cases} \frac{1}{b-a} & a \le x \le b \\ 0 & otherwise \end{cases}$$

Check and make sure that p(x) integrates to 1.

GAUSSIAN DISTRIBUTION

• A variable X has a Gaussian distribution with mean μ and variance σ^2 , if it has the PDF

$$p(x) = \frac{1}{\sqrt{2\pi\sigma}} e^{-\frac{(x-\mu)}{2\sigma^2}}$$

$$0.45 \\ 0.4 \\ 0.35 \\ 0.3 \\ 0.25 \\ 0.15 \\ 0.11 \\ 0.05 \\ 0.10 \\ -10 \\ -5 \\ 0 \\ 0 \\ 5 \\ 10$$

Can p(x) be ever greater than 1?

28

CONDITIONAL PROBABILITY

- We want P(Y | X=x) where X is continuous, Y is discrete
- P(Y | X=x) = P(Y,X=x) / P(X=x)
 - What's wrong with this expression?
- Instead, we use the following expression

$$P(Y \mid X = x) = \lim_{\varepsilon \to 0} P(Y \mid x - \varepsilon \le X \le x + \varepsilon)$$

CONDITIONAL PROBABILITY

- \circ We want p(Y | X) where X is discrete, Y is continuous
- o How would you represent it?

EXPECTATION

$$E_{P}[X] = \sum_{x} xP(x)$$

$$E_{P}[X] = \int_{x} xp(x)dx$$

$$E_{P}[aX + b] = aE_{P}[X] + b$$

$$E_{P}[X + Y] = E_{P}[X] + E_{P}[Y]$$

$$E_{P}[X | y] = \sum_{x} xP(x | y)$$

What about E[X*Y]?

VARIANCE

$$Var_{P}[X] = E_{P}[(X - E_{P}[X])^{2}]$$

$$Var_{P}[X] = E_{P}[X^{2}] - (E_{P}[X])^{2}$$

Can you derive the second expression using the first expression?

$$Var_{P}[aX+b] = a^{2}Var_{P}[X]$$

What is Var[X+Y]?

Uniform and Gaussian Distribution

- If $X \sim N(\mu, \sigma^2)$, then $E[X] = \mu$, $Var[X] = \sigma^2$
- What about the expectation and variance of a uniform distribution?

33

SUMMARY

- Definition of probability
- Conditional rule
- Summation rule
- Bayes rule
- Chain rule
- Marginal independence
- Conditional independence
- Querying a distribution
- Number of parameters
- Continuous spaces
- Uniform distribution
- Gaussian distribution
- Expectation
- Variance
